most people remember the first time they felt completely lost in a science class the diagrams the hormone names the cycles that never seemed to end reproductive physiology is one of those subjects that often feels more like decoding a foreign language than learning how the human body works but what if it didn t have to be that way this book was written for students who crave clarity not more confusion it takes the most important ideas in reproductive physiology and explains them in plain language with a tone that feels more like a trusted friend than a lecture complex topics are broken down into manageable pieces and clever mnemonics help the facts stick without endless repetition inside you ll find everything from how sperm and eggs are made to what really happens during the menstrual cycle pregnancy and menopause each chapter is designed to build your confidence not just your knowledge even if science was never your favorite subject reproductive physiology made easy will show you that understanding the human body isn t just possible it s actually fascinating you might even start to enjoy it perfect for students in medicine nursing biology or anyone who wants to truly get it this book turns memorization into mastery

this volume presents the highlights of current global thinking about sexual and reproductive health major changes have taken place in the last 15 years in the way decision makers think

about the subject and the manner in which programmes deliver comprehensive sexual and reproductive health services the turning point was the international conference on population and development icpd held in cairo egypt in 1994 icpd was a watershed for several reasons first more than in any of the preceding united nations population conferences the issue of population was clearly placed as being central to sustainable development second the narrow focus on population growth the population bomb which had been a neo malthusian concern and preoccupation ever since the club of rome published its 1972 report limits to growth was replaced by the comprehensive concept of sexual and reproductive health third and linked to the definition and introduction of the reproductive health concept was the strong call for a paradigm shift away from a policy environment driven by demographic considerations sometimes to the point of using coercion in family planning services in order to reach demographic targets to an environment that recognized the right of individuals to make their own choices and last but not least icpd as well as the fourth world conference on women fwcw held the following year in beijing people s republic of china strongly emphasized that the rights of women and men to good sexual and reproductive health are firmly grounded in universal human rights provided by publisher

the new millennium has seen a major paradigm shift in insect endocrinology great advancements are being made which establish that nutrition and growth play a central role in diverse cellular and physiological phenomena during insect development and reproduction nutrition affects rates of growth and is mainly regulated by the function of the pathway of insulin insulin like growth factor signalling this pathway is highly conserved across species and ultimately regulates rates of cell growth and proliferation in growing organs insulin and insulin like peptides ilps are some of the best studied hormones in the animal kingdom and all share a common structural motif and initiate a wide range of closely similar physiological processes in higher organisms in insects nutrition via circulating sugar promotes release of ilps from brain neurosecretory cells into the haemolymph which act on peripheral tissues and stimulate protein synthesis and cell growth therefore insect ilps are common mediators between nutrition and growth in insects and are functionally analogous to mammalian insulin

the 1980s and 1990s witnessed great progress in elucidation of the physiological and molecular mechanism of action of numerous insect hormones involved in regulation of growth development reproduction and metabolism but the signals for the initiation or termination of controlled events remained largely unknown ilps were first identified from the silkmoth bombyx mori and were named bombyxins but related peptides were soon found in numerous species and their functions elucidated the insulin signalling pathway is now recognized as a central factor in the timing of cell proliferation growth longevity reproduction and reproductive diapause as well as social behaviour recent work has revealed that the insulin signalling pathway is closely integrated with that of various other hormones including ecdysteroids the juvenile hormones and neuropeptide s such a prothoracicotropic hormone in addition the pathway is also linked with both circadian daily and photoperiodic seasonal clocks potentially providing a basis for its timing function this research topic aims to provide the only current collection of recent advances on insect ilps we encouraged submissions on all areas related to identification characterization regulation and physiological functions of insect ilps we welcomed both full and short reviews and original research articles

this book is a completely revised and updated second edition of a highly praised volume that was first published in 1968 taking into account recent conceptual and technical advances the new edition examines and compares the reproductive mechanisms of different classes of vertebrates from cyclostomes to humans in a thorough and analytic manner ari van tienne is a uniquely qualified scientist with many years of research and teaching experience his fourteen chapters cover sex determination sexual development intersexes puberty anatomy of the reproductive system the testes the ovary reproductive cycles insemination and fertilization care of the embryo and fetus expulsion of the oocyte embryo or fetus reproduction and immunology reproductive behavior and environment and reproduction the author emphasizes the role of the h y antigen in determining the sex of animals and gives particular attention to the evolutionary aspects of intersexes in fish he discusses the endocrinology of reproduction and he also deals with the role of light in controlling the

timing of reproductive activity many illustrations tables and references are included an important contribution to the fields of comparative endocrinology and reproduction this book will be a valuable text for advanced undergraduate and graduate students and an irreplaceable reference for zoologists in general and for specialists in reproductive physiology
